

Internationalization and Accessibility proof apps

Suyash Joshi

Senior Software Engineer
San Francisco Bay Area
Oracle

- Globalization of Tizen app (g18n)

- TAU for g18n

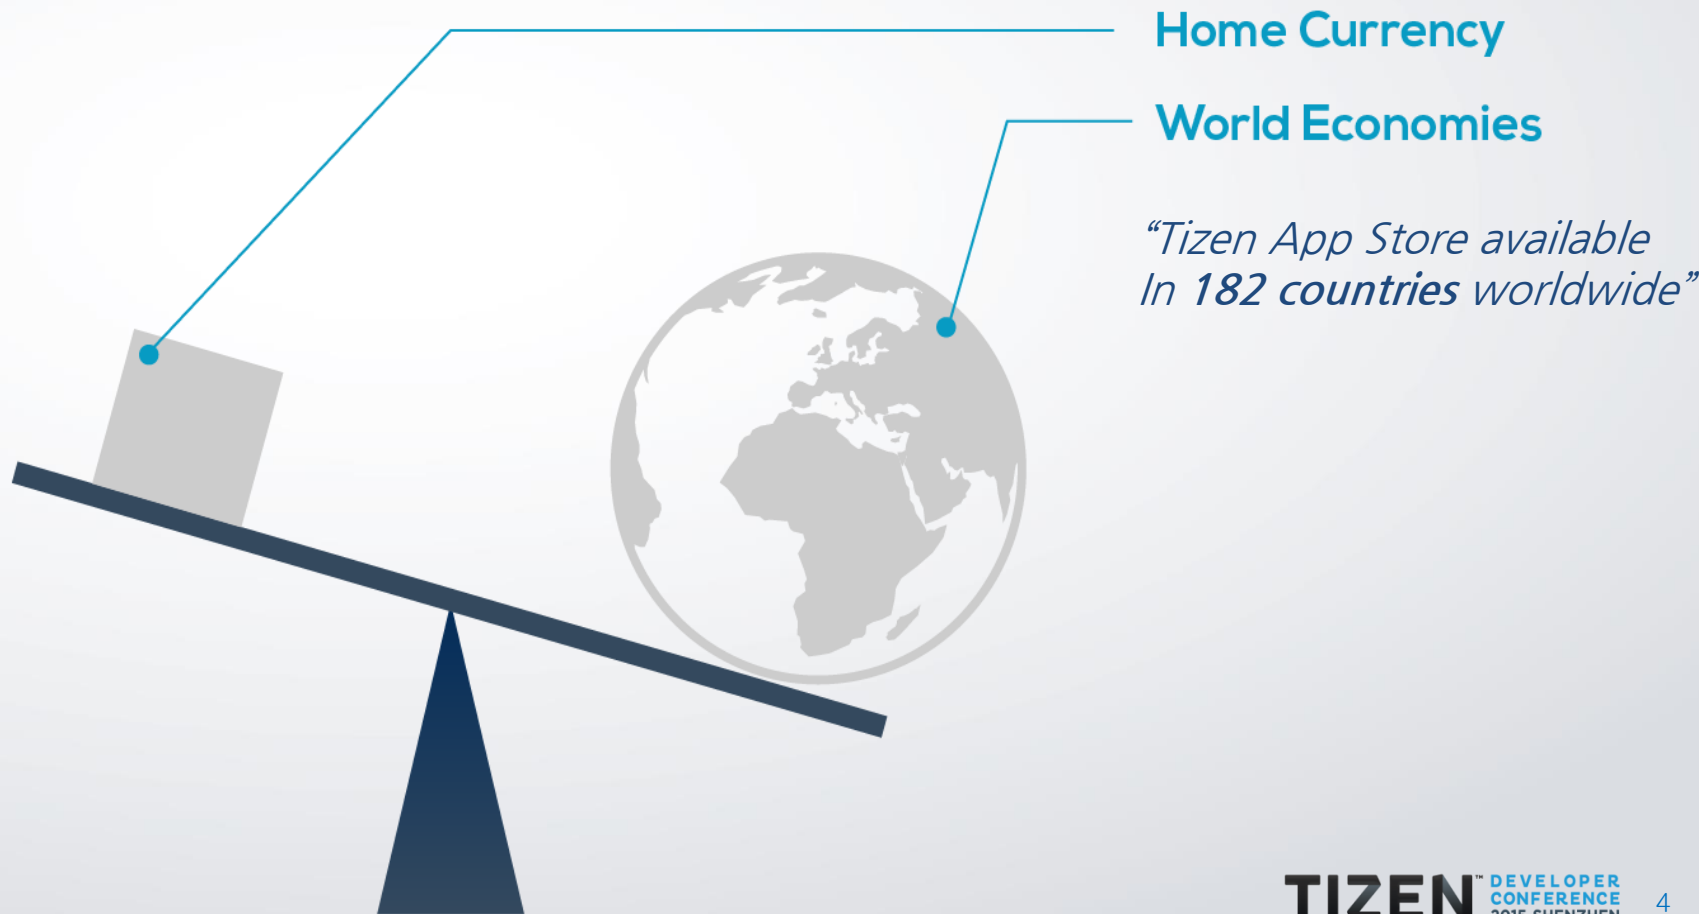

- Accessibility Enablement for Tizen applications (ally)

Internationalization: Think Global Act Global \$, ¥, €, £

Globalization: Think Global Act Global \$, ¥, €, £

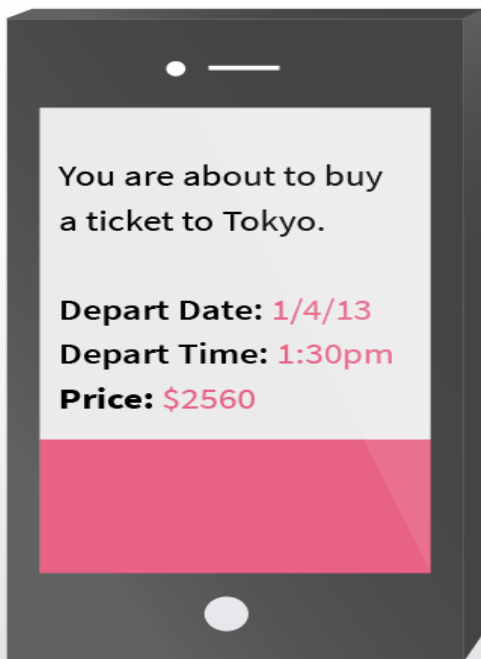

Globalization : Basic Terminology

- **Internationalization (i18n):** It is a process of designing a software application so that it can *potentially* be adapted to various languages and regions without engineering changes
- **Localization (l18n):** Main task is to enable translation for text and images for contextual and cultural fit
- **Globalization (g18n):** Internationalization + Localization constitutes globalization
- **Locale & Regional Formatting:** Setting appropriate date, time and numbers for different regions and languages.

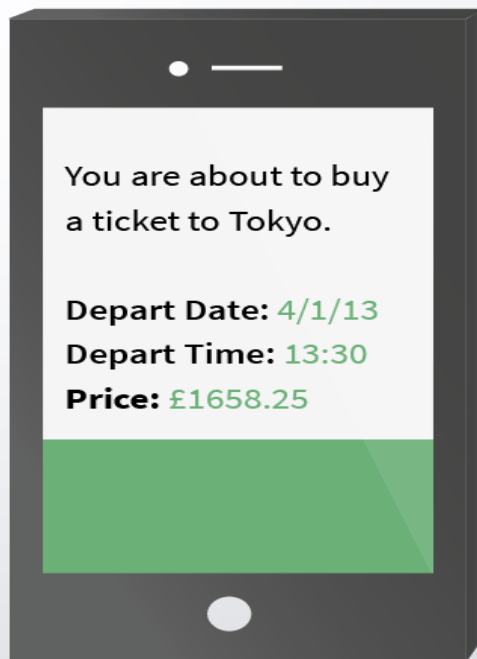

Internationalization: Simple Example

A US app viewed from a device with UK English as default language

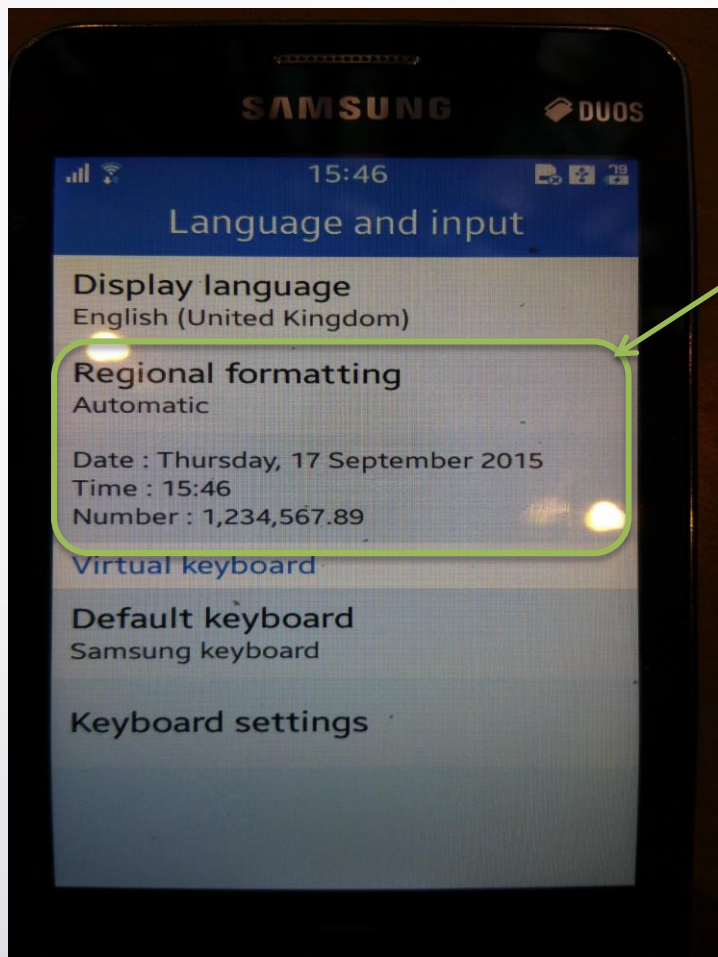

Not Internationalized

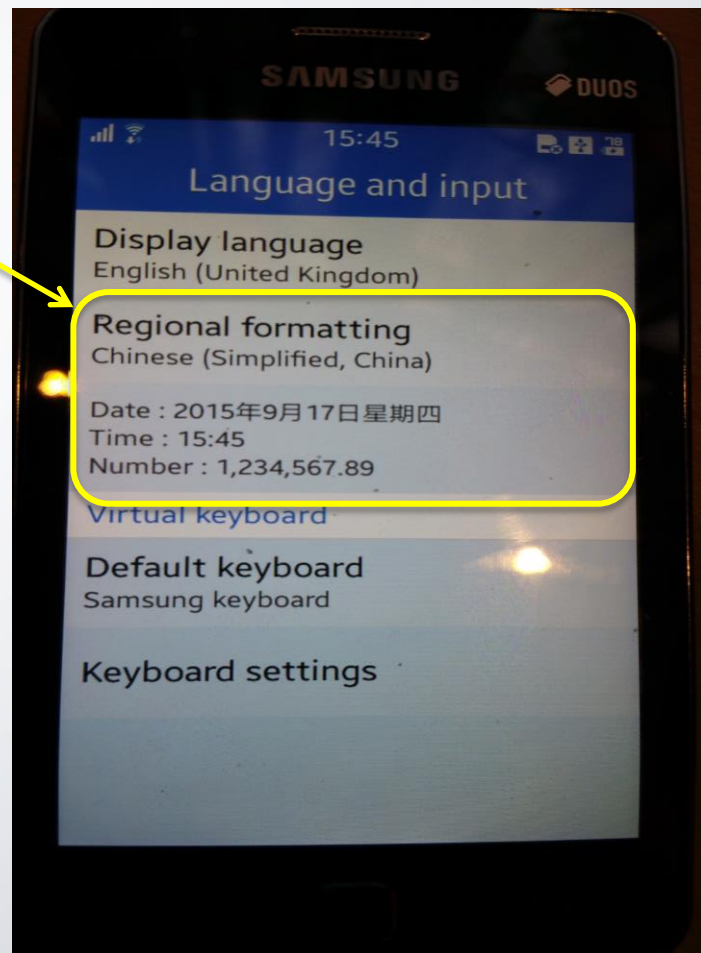

Internationalized

Localization on Tizen phone (Samsung Z1):

Locale

Developer Guide: “Hello World” of Localization or “i10n”

#1: Create Folder Structure for supported languages (individual JS file within):

```
index.html
└─ locales
    └─ en
        └─ language.js
            └─ ko
                └─ language.js
```

#2: Create JS Object such as “**LANG_JSON_DATA**” in **ko/language.js** file

```
LANG_JSON_DATA= {
    "hello": "안녕"
}
```

Developer Guide: Localization or “i10n” ?

#3: Include JS files in your index.html file and log the string object

```
<script src="language.js"></script>
```

```
<script type="text/javascript">
```

```
  log("hello="+LANG_JSON_DATA["hello"]); // based on language setting will print “hello”  
</script>
```

#4: Run your app and inspect the console:

-----Console output-----

안녕

Language tags for content and code

locale ID / 2 letter language code	Meaning
hi-in	Hindi (India)
en-us	English (United States)
es-mx	<i>Spanish (Mexico)</i>
fr-ca	French (Canada)
zh-cn	Simplified Chinese (中文 简体))
zh-hk	Chinese Traditional (Hong Kong)
ko-KR	Korean (Rep. of Korea)

Internationalization: HTML lang attribute to set the content

#1: Set the correct HTML lang attribute for your primary content language

- Useful for **SEO** to index content in that particular language
- Useful for **Screen readers (ally)** to pronounce the words correctly
- Useful for **CSS styling** for that particular language

```
<html lang="en">
```

```
...
```

```
...
```

```
html[lang=en] {  
    /* CSS rules for English */  
}  
html[lang=zh] {  
    /* CSS rules for Chinese */  
}
```

Internationalization: HTML dir attribute to set the directionality

`<html dir="rtl">` or `<html dir="ltr">`

- “dir” attribute is set to **ltr** (left to right) for most languages including Chinese and English
- **RTL Language and regions** : Arabic (Gulf Countries), Hebrew (Israel), Urdu (India, Pakistan)

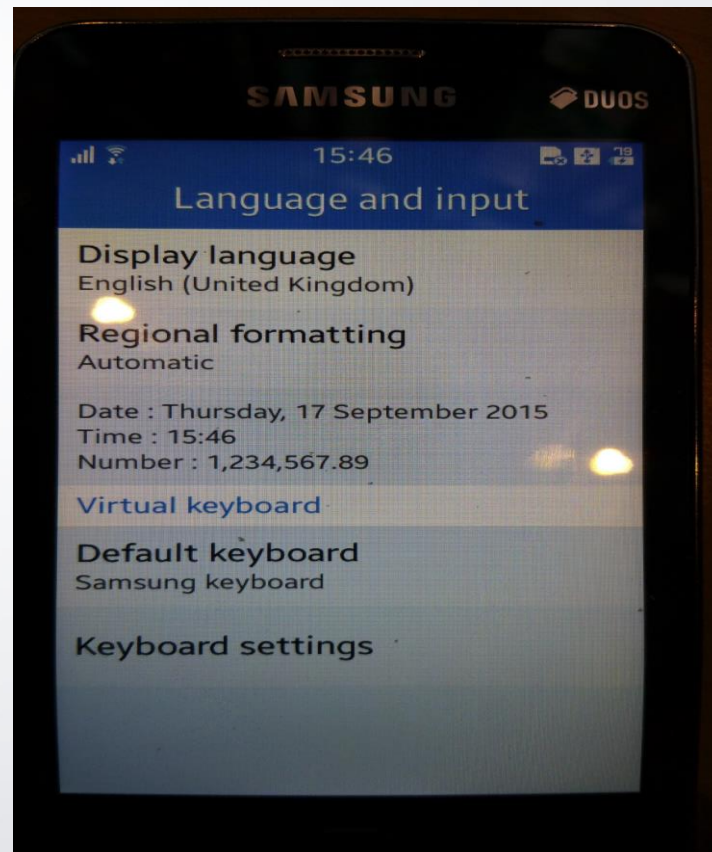

```
<html dir="rtl">
```

```
...
```

```
...
```

```
html[dir=rtl] {  
  /* CSS rules for RTL layout */  
}  
html[dir=ltr] {  
  /* CSS rules for LTR layout */  
}
```

RTL Layout in Tizen (Samsung Z1): Urdu

Tizen Advance UI Framework (TAU) version 2.4

Title	Description
<u>Base</u>	References of base APIs to organize and managing application.
<u>Mobile UI Components</u>	References of UI Components for Mobile profile.
<u>Wearable UI Components</u>	References of UI Components for Wearable profile.
<u>Gesture Events</u>	References of TAU-specific gesture event.
<u>Globalization</u>	References of Globalization utility library.
<u>Animation</u>	References of Animation APIs.
<u>Accessibility</u>	Support for screen reader since 2.1

Globalize.js: JS based library to support i18n & l18n

- Leverages the Unicode CLDR data and follows its UTS#35 specification.
- Keeps the code modular. Allows you to load the i18n functionalities (date, time, number, currency etc.) you need then.
- Runs on Tizen*, web browsers & Node.js consistently across all of them.
- Dependencies
 1. jQuery : use globalize.js as a jQuery plugin
 2. cldr.js : translation information per Unicode standard
- *git clone https://github.com/jquery/globalize*

Tizen Advance UI Framework

- TAU is ECMAScript5- and HTML5-compliant
- TAU is a **standalone library**, but better leveraged with jQuery
- TAU is **optimized** for wearable, mobile, and TV devices.

```
<html lang="eng" dir="ltr">  
  <meta name="viewport" content="width=device-width, initial-scale=1">  
<title>Page Title</title>
```

```
<script type="text/javascript" src="../../lib/tau/mobile/js/tau.js"> </script>
```

```
<link rel="stylesheet" href="../../lib/tau/mobile/theme/default/tau.css">
```

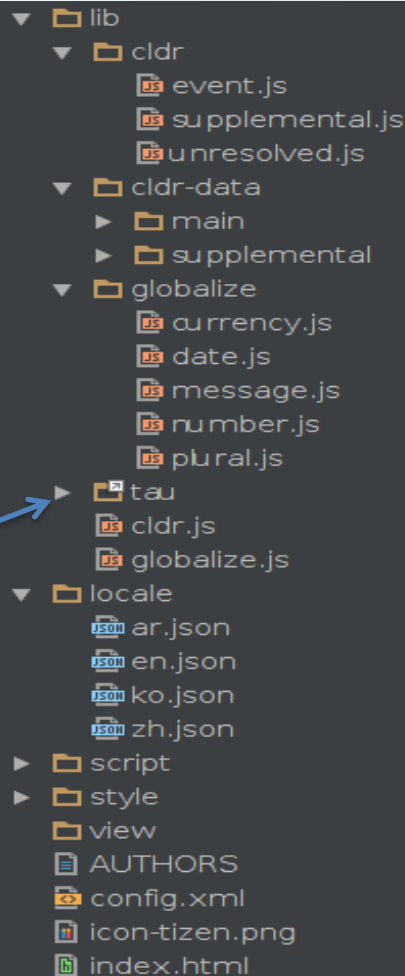

```
<script type="text/javascript" src="myapp.js">
```

```
...
```

```
</script>
```

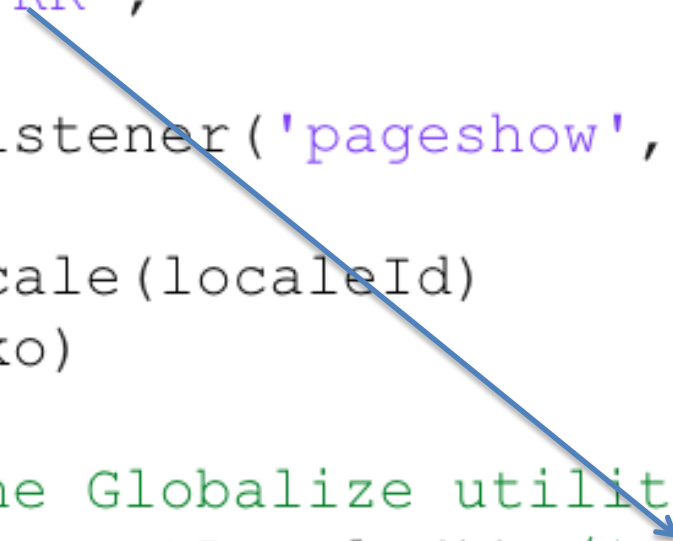

```
<link rel="stylesheet" href="my.css"/>
```

```
...
```

TAU globalize.js : setLocale() helper method

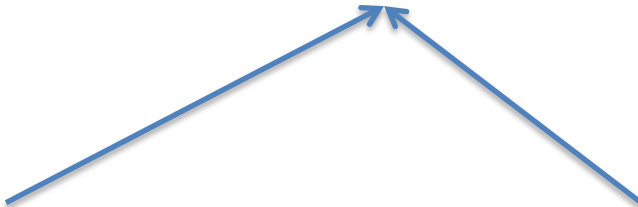

```
var globalize = tau.util.globalize,  
    localeId  = "ko-KR";  
  
document.addEventListener('pageshow', function()  
{  
    globalize.setLocale(localeId)  
    .done(function(ko)  
    {  
        /* "ko" is the Globalize utility instance */  
        console.log(ko.getLocale()) /* "ko" */  
    })  
})
```

TAU globalize.js: formatCurrency() helper method

```
var globalize = tau.util.globalize,  
    localeId  = "ko-KR",  
    currency_unit = "KRW"; /* ISO 4217 */  
  
document.addEventListener('pageshow', function()  
{  
    globalize.setLocale(localeId)  
    .done(function(ko)  
    {  
        console.log(ko.formatCurrency(69000, currency_unit)); /* ₩69,900  
    })  
}))
```

Format based on localeId

- TAU for g18n

- **Accessibility Enablement for Tizen applications (ally)**

What is Accessibility or 'ally' & Why care about it?

15% of population = 1 Billion people
have some kind of disability

How to make sure Tizen apps are fully accessible?

1. **Semantic Content** and valid **HTML**

2. **Ease of use** in user experience

1. **Flexibility** of interaction (touch, vibrate, sound, visual etc.)

1. Make sure **screen readers and accessibility services work** under real world use

Accessibility Proof: Steps

#1 Value HTML markup:

- Use **semantic HTML** markup elements and not just <div>
- Use “**tabindex**” Attribute : Set values only for accessibility purpose only

#2 Add WAI-ARIA into your HTML code:

- Better approach
- Read spec to understand roles and attributes2

Tizen Screen Reader reads in the following order:

1. Content The actual element content is read first.
 2. Other attributes than role and aria-label
 3. role attribute
1. aria-label attribute

```

```

```
<div tabindex="0">
```

```
<div>on</div>
```

```
<div aria-hidden="true">
```

```
off
```

```
<div>child</div>
```

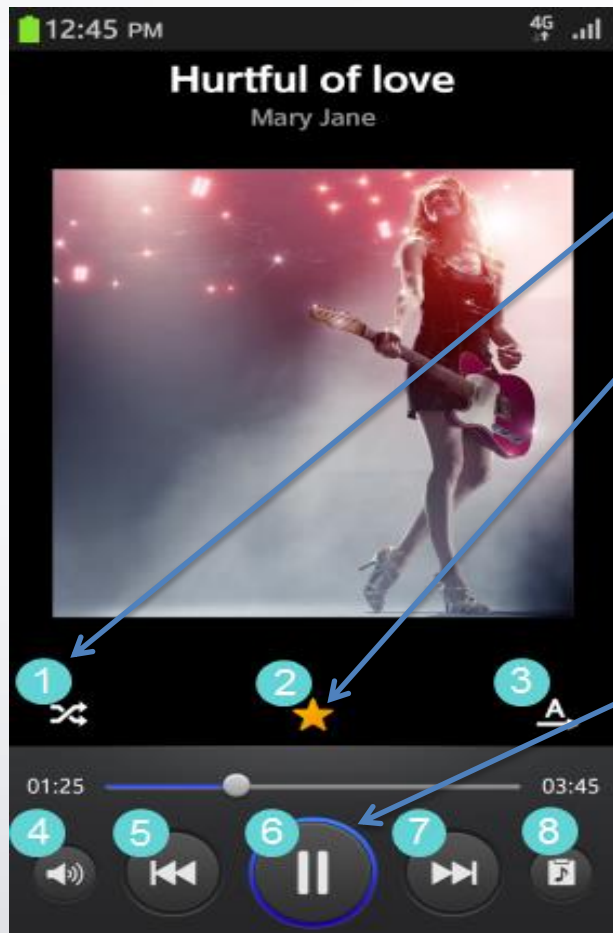

```
</div>
```

```
</div>
```

Tizen Screen Reader : Navigate using Screen Reader mode

Interaction	Screen reader ON
Tap	Select an object.
Double tap	Execute the object.
Double tap and hold	Execute a long tap function.
Tap and move	Select an object and move focus.
Swipe	Select a previous or next object.
2-finger swipe	Scroll the page or unlock.
2-finger tap and move	Pan.

WAI-ARIA : Set state of UI components using ARIA

- Shuffle on/off
- Favorite on/off
- Repeat on/off/one
- Volume
- Previous track: double-tap and hold to rewind
- Play/pause
- Next track: double-tap and hold to forward
- Current playlist

Twins: Usability & Accessibility for improved UX

UX Tip: Use High Contrast for Images and Text

Description

Points to remember ...

1. Start local but **think global!**
2. More people need your help in terms of **making technology accessible**
3. **Accessibility and UX** go hand in hand
4. **Leverage framework** resources (**TAU**) that come bundled for free
5. **Going the extra mile now is easier** than later and more than worth it.
